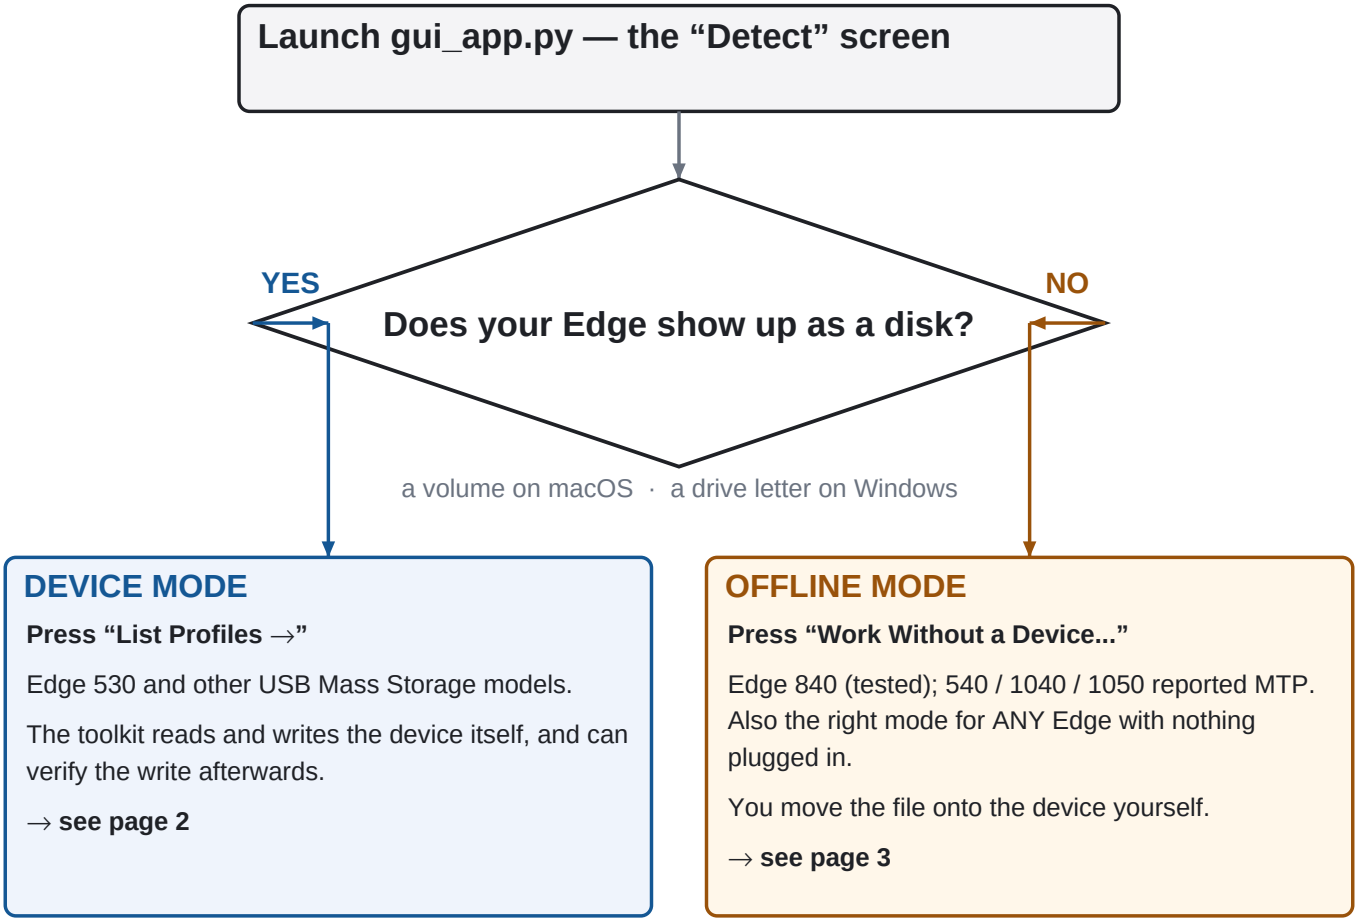
Which path do I take?

The toolkit works two ways, and which one you get depends on how your Edge connects to the computer — not on how old it is. Model numbers are a useful hint; the mount behaviour is the actual test.



What you can do in each mode

	DEVICE	OFFLINE
Edit screens, fields, layout, order, show/hide	yes	yes
Add or remove a screen · save a Favorite	yes	yes
Clone a profile under a new name	yes	yes
Import a .fit profile from anywhere	yes	yes
Edit the boot message (startup.txt)	yes	yes
Restore from a backup, or re-create a deleted profile	yes	no
Pre-Flight review before writing	yes	no
Write to the device, then verify it landed	yes	no

True in both modes, and worth knowing

- Garmin/NewFiles/ is the only import route — copying into Garmin/Sports/ does not import a profile.
- The Edge renames every profile it imports, from the file’s own sport and display name.
- New profile or replacement is decided by the display name inside the file, never by the filename.
- A restart is required after copying — the Edge imports on boot, not on connect.
- The on-device editor manages at most 10 user screens, so the toolkit refuses to create an 11th.

Device mode — the Edge mounts as a disk

Everything happens in the app. The toolkit backs up before it touches anything, shows you exactly what will change, and checks the write afterwards.

1. Press “List Profiles →”

Every profile on the device is backed up first, automatically. Backups are keyed by the device serial, so two Edges never share a folder.

2. Choose what to do

View Screens → edit the profile
Change fields and layout variant, reorder or hide screens, add or remove one. Save any screen as a Favorite to reuse in another profile.
Clone... copy it under a new name
The suggested filename matches what the Edge will generate. Screens copy across; the odometer starts at zero.
Restore from Backup...
Any earlier snapshot — including profiles you deleted from the device, which are re-created.
Import Profile... a .fit from anywhere
Startup Message... the text shown at boot

3. “Review & Deploy...” — Pre-Flight

A plain list of exactly what will change on the device, and a fresh CRC check of the file. Nothing has been written yet; you can still go back.

4. “Write to Device”

The file is copied into Garmin/NewFiles/, then read straight back and compared byte for byte before the app calls it done.

5. Eject, then RESTART the Edge

The Edge imports on boot, not on connect. On restart it reads NewFiles, applies the profile, renames the file, and empties the folder.

6. Reconnect and press “Check”

The toolkit finds your profile by the DISPLAY NAME stored inside it, because the Edge has renamed the file by now. It compares what is live on the device against what was sent.
“No differences” is the PASS — it means the write landed.

Offline mode — the Edge does not mount

Newer Edges connect over MTP and never appear as a disk, so the toolkit cannot reach them. You copy the files across yourself, edit them on the computer, and copy the result back.

1. Copy your profiles off the device (outside the app)

Browse the Edge with OpenMTP or Commander One on macOS, or Explorer on Windows, and copy everything in Garmin/Sports/ into a folder on your computer.
That folder is what the toolkit will read.

2. Press “Work Without a Device...” and pick that folder

Nothing is ever written back into it — Export always asks where to save.

3. Choose what to do

View Screens → edit the profile
The same editor with the same guards. Everything about screens, fields and layouts works offline.
Clone... works offline
Import Profile... works offline
Startup Message... reads and writes startup.txt in the folder

Restore from Backup is NOT available here — restoring writes to a device. Open your BACKUP folder as the source folder and Export from it instead.

4. “Export...” — save it wherever you like

Verified twice before the app reports success: the file’s own checksum against its contents, then a byte-for-byte read-back of the saved copy.
The filename is yours to choose. The Edge renames it on import anyway.

5. Copy it into Garmin/NewFiles/ (outside the app)

Same MTP browser you used in step 1. NewFiles is the only folder the Edge imports from.

6. Disconnect and RESTART the Edge

It imports on boot. Your profile is updated, the file renamed, and NewFiles emptied.

There is no Pre-Flight and no Check offline

Both have to read the live device to tell you anything, and offline there is no device to read. To confirm a change landed, pull the profile back off and look at it.
